

The name Video Libber is a Trade Marked name I have obtained; through the United States Patent and Trade Mark Office for this device. Reg No 3,209,681

Have you ever been watching TV and suddenly you find yourself talking to the set? Thats the idea behind...

THE VIDEOLIBBER

The Videolibber is an electronic device made to hook directly into your Television via standard cables. Once connected you simply turn on both your TV set and Videolibber, insert a recordable DVD into your Videolibber, set the level of your microphones, and your ready to go!

Now, start recording a show of your choice, turn the main mix knob on the Videolibber to adjust the volume between the TV show you are watching and your microphones. Turning the knob all the way to the left will make only the TV heard, all the way to the right only the microphones, with the space in between being a mixture of both sources.

Once you've selected a show, you can insert your own dialogue over the existing dialogue while it's in progress. Play along with up to four or more people to create hilarious scenes! Now You are the star! The Videolibber is truly interactive television at its most basic level.

When you are done, stop recording and playback the DVD you made. Its guaranteed to make you laugh!

You can use already existing footage from movies you have to create a new version, with dialogue that you and friends have added without interrupting the original integrity of the movie you own or have rented. Simply insert the DVD movie you wish to interact with on the left side of the Videolibber and insert a recordable DVD on the right side. Press play and record. Interject dialogue with the microphones. When you are finished watch the new DVD movie with your voice over where the actors voice once was.

It is envisioned, as the device catches on, special Digital Video Libber Disc's would be made available, through the companies that own the copy rights to such movies. This would provide more advanced entertainment. ie high lighted prompting dialogue on screen, track with actors voices, sound effects, music etc., all would be removable or adjustable through the Video Libber. The Disc's would be stamped with the trade mark name. For example (Star Wars Digital Video Libber Disc) (DVLD).

If normal television viewing is desired, simply turn the Videolibber off, make sure the AUX switch is in the normal position. The signal is passed through without any interruption.
